To solve problems caused by:

Humidity

Climatic conditions

## Valuable data, in real time!

**PROPASECARD** is a stiff card with reversible reading spots, “cobalt-dichloride free”, changing the colour from blue to pink when a certain relative humidity (RH) level has been exceeded.

**PROPASECARD** has to be put into the packaging of the product that you want to control and it is available in several versions.

**PROPASECARD** can monitor low relative humidity levels down to a 5% RH, or high levels up to a 90% RH, according to the application and necessity.

It provides an immediate visual proof of the level of RH in an environment and/or packing. If the humidity level shown is too high, users will in real time know they have to replace the desiccant and check that the product quality has not been altered.

**PROPASECARD** is particularly suitable to be used with desiccants in any application.

The humidity indicator **PROPASECARD** is easy to use and quickly readable. Spots are blue in absence of moisture, and they turn to pink when reaching the various humidity levels shown.

**Indicators with viewing window: PROPASECARD with viewing window** can be put in protective bags and caps too, in order to control the relative humidity rate inside the packaging looking from outside.

## Main applications:

- Electronics
- Military components
- Optical instruments
- Packing
- Automotive sector
- Diagnostics
- Museums and works of art

Thanks to Propasecard humidity indicators, you will know immediately the humidity level to which your products were exposed during transport and storage.
